

SmartShopping Sample Overview

Windows Partner Enablement Team
Microsoft, Taiwan

Agenda

- Scenario & Solution Overview
- Design Overview
- Backend Services
- Frontend Apps

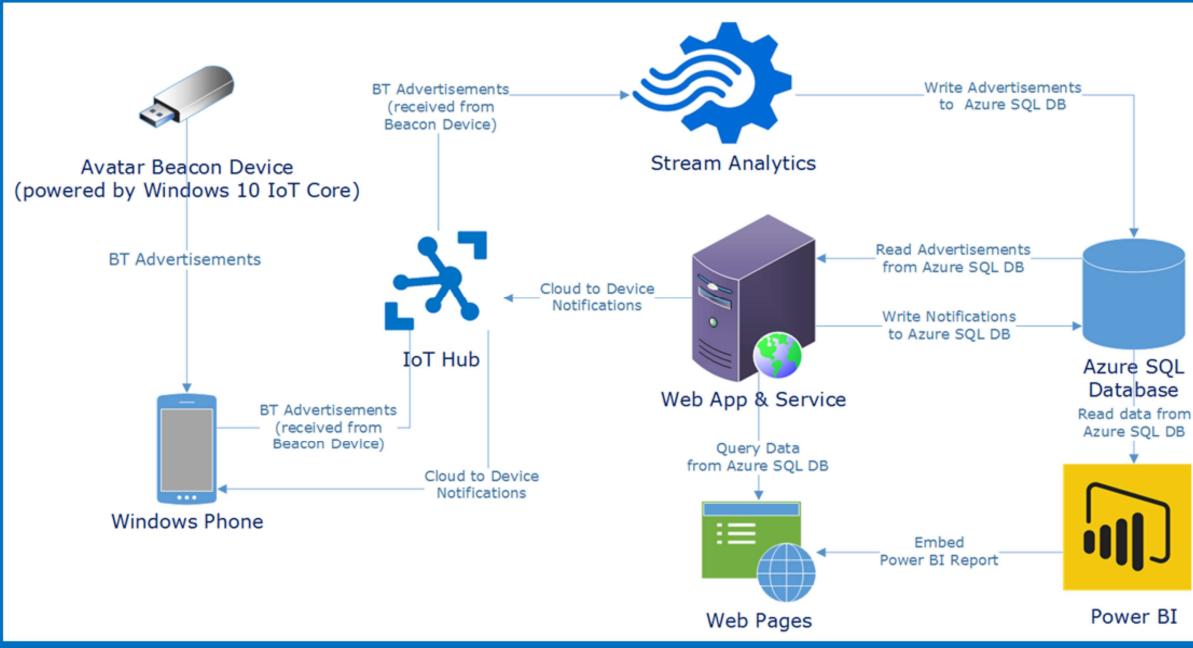

Scenario Overview - Retail

- To do targeting promotion to guests that come close to the hot spot setup on retail floor.
- To collect guests visit data on retail floor or booth.
- Use BLE beacon to declare a hot spot.
- A hand-held device for guests to report position and to receive promotion notification.
- Keep data on Azure for advanced use.

Solution Overview – Technologies

- BLE Advertisement
- Azure – IoT Hub, Stream Analytics job
- Azure - Web App / API App
- Azure – SQL Database
- Windows 10 Mobile – Notification
- UWP App & Background Tasks
- Power BI

Solution Overview – Architecture

Design Overview

- Avatar BLE Beacon (skip in this slides)
- Beacon emulator (test tool for development use)
- Frontend Phone App (UWP App)
- Backend Web Apps (ASP.NET / MVC)

Design Overview - Beacon Emulator

- A test tool to emulate a beacon device, for development use.
- This app is an UWP app modified from UWP Sample – Bluetooth Advertisement
- Run on Windows 10 device that has BLE module
 - Windows 10 Desktop (PC)
 - Windows 10 Mobile (Phone)

UWP Sample

<https://github.com/Microsoft/Windows-universal-samples>

UWP Sample – Bluetooth Advertisement

<https://github.com/Microsoft/Windows-universal-samples/tree/master/Samples/BluetoothAdvertisement>

Design Overview - Frontend Phone App

- A UWP App
 - To watch BLE Advertisement message broadcasted from beacon devices.
 - To send BLE signal information to backend IoT Hub.
 - To receive product promotion message from backend IoT Hub.
 - To toast a notification with product promotion highlights.
 - To show promotion content on screen.
- For Windows 10 mobile devices

Design Overview - Backend Services

- Provide Web UI :
 - For Management / Monitoring / Reports
- Provide RESTful API:
 - For mobile devices (phone app) to get IoT device Identity
- Process messages from/to devices
- Hosted on Azure
 - ASP.NET / MVC / Access to IoTHub / Access to SQL Database

Backend Services – Dev Environment Setup

- Visual Studio 2015
 - Update 2 or later
 - SSDT (SQL Server Data Tools)
 - Azure SDK and Tools
- Azure Account
- PowerBI Client App ID (Optional)
- Source Code:
 - Sample_SmartShopping/Backend/SmartShopping.Azure

Download SQL Server Data Tools (SSDT)
<https://msdn.microsoft.com/library/mt204009.aspx>

Azure SDK for VS 2015
<https://www.visualstudio.com/en-us/features/azure-tools-vs.aspx>

Backend Services – Azure Setup

1. Create ResourceGroup

2. Create IoTHub

- Get [IoTHub ConnectionString]

3. Create SQL Database

- Might will be asked to create SQL Server if there's no existing SQL server.
- Get [SQL Server user account / password] for database connection use.
- Get database connection string [ADO.NET(SQL authentication) ConnectionString]

ADO.NET(SQL authentication) Connection String format:

```
Server=tcp:{server hostname},1433;Initial Catalog={database name};Persist Security Info=False;User ID={your_username};Password={your_password};MultipleActiveResultSets=False;Encrypt=True;TrustServerCertificate=False;Connection Timeout=30;
```

-- When you copy the connection string from Azure portal, the "User ID" and "Password" are not configured in the connection string, you need to fill in your SQL account name and password,

For example :

your SQL server host name: mysqlservername.database.windows.net

your SQL account name: mysqlaccount

your SQL account password: mysqlpassword

Set in connection string like this:

```
"User ID=mysqlaccount@mysqlservername;Password=mysqlpassword;"
```

Backend Services – Azure Setup

4. Create tables in SQL Database

- Run SQL script to create tables (using VisualStudio SSDT):
Sample_SmartShopping/Backend/SmartShopping.Azure/SQLScript/Table
- Run SQL script to create store procedures (using VisualStudio SSDT):
Sample_SmartShopping/Backend/SmartShopping.Azure/SQLScript/Proc
- Run BCP command to populate sample data (optional):
Sample_SmartShopping/Backend/SmartShopping.Azure/SQLScript/Data/bcpin.cmd

SSDT: Visual Studio > View > SQL Server Object Explorer

Backend Services – Azure Setup

5. Create Stream Analytics job

- On Azure portal, set Input from IoTHub, named as “InputIoTHub”
- On Azure portal, set output to SQL Database table, named as “OutputSQL”
- On Azure portal, set query copied from:
Sample_SmartShopping/Backend/SmartShopping.Azure/SQLScript/StreamAnalytics/StreamAnalytics_Query.sql
- Start job manually

Backend Services – Azure Setup

6. Create Web App for Web UI

- On Azure portal, create “Web App”, named for example as “MySmartShoppingSampleWeb”
- In Application settings, Add in “App settings”
 - Add “IohubConnectionString” =“(AzureConfig- IoT Hub ConnectionString)”
 - Add “ProcessBaseUrl” =“(AzureConfig- Process Base Url)”
 - Add “ServiceBaseUrl” =“(AzureConfig- Process Base Url)”
 - Add “PowerBIClientId” =“(AzureConfig- PowerBI Client Id)”
 - Add “PowerBIAccessKey” =“(AzureConfig- PowerBI Access Key)”
 - Add “PowerBIPassword” =“(AzureConfig- PowerBI Password)”
 - Add “PowerBIRecordId” =“(AzureConfig- PowerBI Record ID)”
- In Application settings, Add in “Connection strings”
 - Add SQL Database “SmartShoppingSampleDB” =“(AzureConfig- SQL DB ConnectionString)”

Storing Your Secrets in Azure Websites App Settings

<https://blogs.msdn.microsoft.com/cdndevs/2015/03/20/storing-your-secrets-in-azure-websites-app-settings/>

Best practices for deploying passwords and other sensitive data to ASP.NET and Azure App Service

<http://www.asp.net/identity/overview/features-api/best-practices-for-deploying-passwords-and-other-sensitive-data-to-aspnet-and-azure>

Authentication and authorization in Azure App Service

<https://azure.microsoft.com/en-us/documentation/articles/app-service-authentication-overview/>

Create a REST service using ASP.NET Web API and SQL Database in Azure App Service

<https://azure.microsoft.com/en-us/documentation/articles/web-sites-dotnet-rest-service-aspnet-api-sql-database/>

-- BaseUrl examples:

“ProcessBaseUrl” = “<https://mysmartshoppingsampleprocess.azurewebsites.net>”

-- PowerBI report Id, browse to PowerBI Report, Find Report ID (GUID) in URL:

<https://msit.powerbi.com/groups/me/reports/<report-guid>/ReportSection>

Backend Services – Azure Setup

7. Create Web App as API Service

- On Azure portal, create “Web App”, named for example as “MySmartShoppingSampleService”
- In Application settings, Add in “App settings”
 - Add “IoThubConnectionString” = “(AzureConfig- IoTHub ConnectionString)”
- In Application settings, Add in “Connection strings”
 - Add SQL Database “SmartShoppingSampleDB” = “(AzureConfig- SQL DB ConnectionString)”

Create a REST service using ASP.NET Web API and SQL Database in Azure App Service

<https://azure.microsoft.com/en-us/documentation/articles/web-sites-dotnet-rest-service-aspnet-api-sql-database/>

Backend Services – Azure Setup

8. Create Web App to process messages

- On Azure portal, create “Web App”, named for example as “MySmartShoppingSampleProcess”
- In Application settings, Add in “App settings”
 - Add “IoThubConnectionString” = “(AzureConfig- IoTHub ConnectionString)”
- In Application settings, Add in “Connection strings”
 - Add SQL Database “SmartShoppingSampleDB” = “(AzureConfig- SQL DB ConnectionString)”

Create a REST service using ASP.NET Web API and SQL Database in Azure App Service

<https://azure.microsoft.com/en-us/documentation/articles/web-sites-dotnet-rest-service-aspnet-api-sql-database/>

Backend Service – Build / Debug Web Apps

- Use Visual Studio 2015 to open
 - Sample_SmartShopping/Backend/SmartShopping.Azure/SmartShopping.Azure.sln
 - Create local debug web config
 - Copy config files from Sample_SmartShopping/Backend/SmartShopping.Azure/Config to Sample_SmartShopping/Backend
 - Remove “template” from Sample_SmartShopping/Backend/*.config file name like this: AppConnectionStrings.localdev.config, AppSettingsSecrets.localdev.config
 - Edit content in config files at “Sample_SmartShopping/Backend”, fill in corresponding information, such as IoTHub connection string and database connection string
- Build and debug locally before publish to Azure.

Best practices for deploying passwords and other sensitive data to ASP.NET and Azure App Service

<http://www.asp.net/identity/overview/features-api/best-practices-for-deploying-passwords-and-other-sensitive-data-to-aspnet-and-azure>

-- The settings in local config file are identical to those set in Azure application settings.

Backend Service – Publish Web Apps

- Each project is a Web App.
 - Publish to corresponding Azure Web App:
 - Project "SmartShoppingService" -> Azure Web App "MySmartShoppingSampleService"
 - Project "SmartShoppingProcess" -> Azure Web App "MySmartShoppingSampleProcess"
 - Project "SmartShoppingWeb" -> Azure Web App "MySmartShoppingSampleWeb"

Frontend App – Dev Environment Setup

- Visual Studio 2015
 - Update 2 or later
- Ensure backend services should be ready
- Source Code:
 - Sample_SmartShopping/Frontend
- A Windows 10 mobile device as test device

-- This UWP app could be run on Windows phone (Windows 10) or Windows 10 tablet

Frontend App – Build / Debug UWP App

- Use Visual Studio 2015 to open
 - Sample_SmartShopping\Frontend\SmartShopping.PhoneApp.sln
- Edit configuration file at
 - Sample_SmartShopping\FrontEnd\SmartShopping.PhoneApp\Data\SmartShoppingSample.Config.xml : "ServiceBaseUrl"
- Build “SmartShopping.PhoneApp” project.
- Connect phone device via USB.
- Debug/Deploy phone app to phone device to test.

```
<config Key="ServiceBaseUrl" Value="https://mysmartshoppingsampleservice.azurewebsites.net/" />
```

-- If target device is a tablet, the device should be connected via wired ethernet or Wifi, and using remote debugging to debug the app running on target tablet device:

<https://msdn.microsoft.com/en-us/library/y7f5zaaa.aspx>

Beacon Emulator – Build / Debug UWP App

- Download complete UWP sample code tree from github.
- Extract beacon emulator code from zip file:
BluetoothAdvertisement.BeaconEmulator.20160804.zip
- Copy beacon emulator source code folder to UWP sample code tree
 - Windows-universal-samples\samples\BluetoothAdvertisement.BeaconEmulator
- Build by using Visual Studio.
- Debug or run the beacon emulator on a local or remote Windows 10 machine.

UWP Sample

<https://github.com/Microsoft/Windows-universal-samples>

UWP Sample – Bluetooth Advertisement

<https://github.com/Microsoft/Windows-universal-samples/tree/master/Samples/BluetoothAdvertisement>

-- If your local machine is not windows 10, you need to use remote debugging. The target machine should be windows 10. The device should be connected via wired ethernet or Wifi, and using remote debugging to debug the app running on target machine.

<https://msdn.microsoft.com/en-us/library/y7f5zaaa.aspx>

Run the sample – Environment Setup

- Confirm all Azure modules are up and running
 - IoTHub / Stream Analytics job / Web Apps (x3)
- Check mobile device
 - Confirm mobile device has internet connectivity
 - Open Bluetooth on mobile device
 - Start UWP app, and login
- Run beacon emulator

-- You could generate UWP app packages (.appx, similar to Android apk) to facilitate app installation, so you may install the app to devices without the use of Visual Studio. However, If target device is windows phone, we still suggest to use Visual Studio to deploy the app to phone device.

-- Please notice that this app is not going to publish to Windows Store, so when you generate the app package using

Visual Studio -> (select a project and right click to show menu) -> **Store->Create App Packages**

You need to choose "No" if you are asked for "Do you want to build packages to upload to the Windows Store?"

Packaging UWP apps

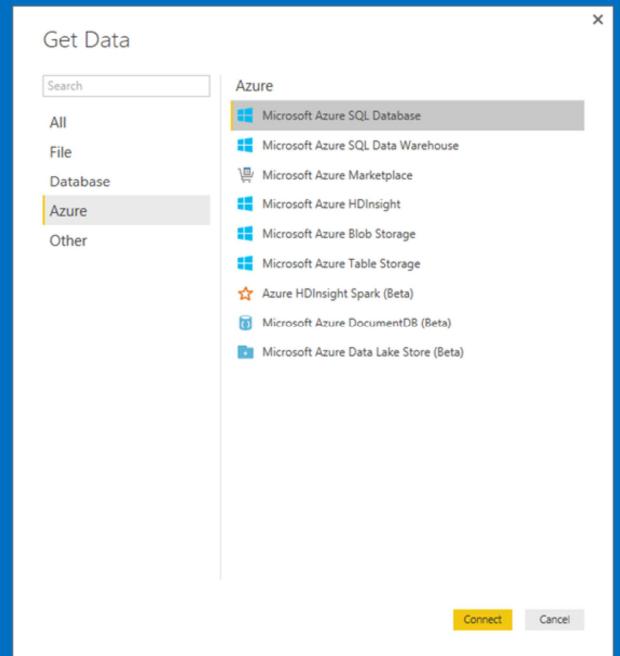

<https://msdn.microsoft.com/en-us/windows/uwp/packaging/packaging-uwp-apps>

Run the sample

- Put mobile device closer to beacon emulator until promotion notification arrived.
- Open web pages to verify results

Power BI – Share Report

- Dataset (Direct Query):
 - Get Data > Azure > Microsoft Azure SQL database
- Edit Report
- Publish to PowerBI Portal
 - Pin Report to Dashboard and Share
 - Find Report Id

PowerBI Portal

<https://powerbi.microsoft.com/en-us/landing/signin/>

Browse to PowerBI Report, Find Report ID (GUID) in URL

<https://msit.powerbi.com/groups/me/reports/<report-guid>/ReportSection>
